Scaling Multi-service Protection OAM

Alcatel-Lucent's Packet Optical Transport systems provide:

- Flexibility in Carrier Class Ethernet Transport Provides carrier class transport for all technologies
- Flexibility for Network Optimization Allows the transport network to be designed to meet the service demands
- Flexibility for Network Evolution Leverages the embedded base while seamlessly allowing transformation to MPLS based packet optical transport
- Flexibility in Network Technology Switches packets and circuits natively
- Flexibility of Network Investment Supports SDH/SONET, WDM/OTN and Ethernet/MPLS in any combination

Packet Optical Transport

Support of TDM/Packet/WDM Carrier Grade in each single category

- Standardized Services
- Quality of Service
- Scalability
- Reliability
- Service Management

Real Manageability

MPLS transport with sophisticated OAM for effective transport of Carrier Ethernet:

- Manageability in Protection** Provides protection equivalent to or better than SDH/SONET: protection switching <50 ms and 1+1, 1:1, N:1 protection schemes in Linear, Ring and DNI architectures
- Manageability in Restoration** Controlled by the network and/or the management system for all network topologies
- Manageability in Performance Monitoring** Allows the management system to monitor and analyze performance data to ensure that SLAs are met
- Manageability in Fault Localization** Powerful fault localization tools in the Management Systems (1350 OMS and 1340 INC) to identify and localize network faults

Real Reliability

PHOTONICS AND WAVE DIVISION MULTIPLEXING

WSS T&ROADM UNIQUE ARCHITECTURE

ROADM Architecture

Wavelength Tracker™

Traditional ROADM

- Wavelength routing at intermediate nodes

Multi-degree ROADM

- Increased connectivity (mesh)

Full Flexibility

- Colorless ports
- Multicasting
- Wavelength routing e2e

Full Operations

- Power, Path, QoS monitoring
- Misconnections management

Photonic Restoration

- GMPLS/ASON
- Re-coloring

Zero-Touch Photonics provided by T&ROADM and Photonic restoration enhance the inherent photonics reliability

Reliable routing of bandwidth with ROADM and Tuneable ROADM

- Traditional ROADM provides flexibility to route between intermediate nodes
- Multi-degree ROADM allows meshing and reduces blocking
- Fully Tuneable ROADM simplifies operations, providing full remote configuration

Reliable Monitoring and Tracking with Wavelength Tracker

- Full Operations with end to end traffic management and automated remote provisioning and assurance

Reliability of "always-on" services with Photonic Restoration

- Photonic Restoration provides resilience and complements digital survivability

Real Solutions

BASED ON OPTICAL CARRIER ETHERNET DEPLOYMENTS

Alcatel-Lucent's Carrier Ethernet Transport (CET) solutions have been used extensively to provide Real Solutions:

- Real Solutions for Mobile Backhaul (Optical and Microwave)** Packet Optical Transport with Microwave Packet Radio provide Mobile Backhaul solutions that allow operators to re-use their embedded base whilst using the inherent qualities of redundancy, high availability and scalability provided by Optics and Microwave platforms
- Real Solutions for Managed Business Networks** Packet Optical platforms allow service providers to offer secure, robust, scalable, Carrier Ethernet Transport solutions to their customers
- Real Solutions for Triple Play Transport** Carrier Ethernet Transport provides an optimized, reliable transport infrastructure for Triple Play
- Real Solutions for Industry and Public Sector** Optics and Microwave provide solutions with the resilience, flexibility, and reliability required to support real-time business and mission-critical operations.
